1 Labs

1.1 Lab 1 - Rasterising Lines

The line drawing function was updated to use an integer based approach. Originally the algorithm was used for positive x,y values and then altered by mirroring the result onto the other three quadrants. This created the following image *ref*. This seems correct, however, on further inspection it was realised that the lines seemed to have a double thickness. This was thought to have occurred as the conditions to be in what quadrant was changing as the line was drawn. Therefore the process was reattempted in an effort to improve and refactor code.

The result was the correct output as shown here. This was done by ..
. Code was refactored into a single x and y direction methods where an initial function call was responsible for determining when to call the relevant one. By calculating directions based off of the start and end coordinates.

1.2 Lab 2 - Reading Models

As the teapot consists of several triangles, a single triangle was considered to be an object. Therefore in the scene class a

1.3 Lab 3 - Simple Raytracing

1.3.1 Raycasting

1.3.2 Triangle intersection

To compute triangle intersections the Möller-Trumbore algorithm was used. This was used instead of the method on the *slides* anticipating the requirements for the barycentric coordinates

to complete Gouraud shading further in the coursework.

1.4 Lab 4 - Basic Lighting and Shadows

1.4.1 Spotlights

1.4.2 Pointlights

The slides refer to two methods to create pointlights, with and without an associated direction. As spot lights are directional, pointlights with a constant intensity were implemented. This allows a pointlight to be placed between objects to cast shadow outwards.

1.4.3 Shadows

3 Advanced Features

3.1 Photon Mapping

Some difficulty was encountered when choosing static libraries, this heavily influenced the chosen library to handle KD Trees. The library chosen is *Alglib* as it was written to be added like normal classes where you include the relevant headers and compile the cpp files.

3.1.1 Random emission - Lighting

Lights had to be updated with relevant random emission direction and position functions. Depending on the light

Pointlight Direction **Position** Spotlight
